Then agent will fetch information from here even later your twitter or whatever agent will. So it is important how we formalize this this Not just to be you know, like a text dump that this is the company that does this and does that So we have to come up with a schema to do that So what is the right schema for us to maintain this business knowledge hub? Because the goal is that once that is established everything will run on autopilot So it should be self-aware And it's Poland's whole goal is to know about the business itself. Any outside information that your agent will take care though That's why we have to split it into a data piece in Internal data piece versus an external data piece, but the knowledge of can be totally internal So we can it should be continuously one week.

So see anything that we generate will be Like anything we put there will be generated great For example, if we have to start What do you do? We go to our website and then see what are the offerings and from that we will come up with this this Build a schema. So first I want you to think about the rights Because at the end the goal is you need all possible information in that schema that is required to generate anything and everything It's from posts to cold email or DM anything, right? Oh What we can do is First you can start by making the space or the schema should be Then Coming to next or to you had said Rather than generating the one-shot content we can come up with different Suggestions that we can do this we can do that rather than just you know generating a bulk of Posts, you know, that is also great But in that again, you have to have a classifier of what kind of course do we need? So if you want to do those maybe you can try to go to different companies or LinkedIn and see what kind of posting you just To understand that every post is offered of a different kind So sometimes you have one specific service line or product line that you want to showcase Sometimes it's a new product launch and you want this like for example and your model comes, right? In GPT-6 scale. So how businesses can use that how we can use that Then it is a world Classifying different kinds of posts or different kinds of Engagement materials Right, it could be customer success stories.

It could be simulations of the thing And then so this is the types which you said Then comes in the generation. Also, you might have different types, right? One could be just a text post, one could be just an image post, one could be a video Programmatic video Broadly we have divided it into three parts as of now knowledge hub, then different pieces different kinds of content pieces and third is the different type of content pieces Kind and type of differences one is about The Problem statement you're trying to highlight in that post and third type is the output type So now your suggestions You'll be aware of the fact that these different type of output types exist It should suggest that also Now I think everything is rule-based these three pieces. So your agent just has to orchestrate across these three I think that's a good take down of the system to start with So for now you can just Work on this skeleton.

Once we get this to work, you can see how we want the UI, how we want anything else Once we get one to working And in the different types also What you can do is The image is straightforward, but Again you'll have to build a pipeline to generate things according to our brand guidelines Then you would want you don't want a random image to be generated based on a topic It has to follow certain templates and guidelines For image, you'll have to take care of that and video has to be programmatically You can look this thing in Reemotion and Hyperflames So These are things that help you generate videos programmatically They're really good. So you have skills for both of them. You can just configure it in your coding flow and it will generate So you can play around with this There's Any anything else that comes to your mind after So what we can do is right now you can But conceptually from part one Conceptualize what all needs to be there.

Don't fill it up right now that Would work like, you know, we give it the website link. It should be able to generate that scheme. So you conceptualize part one And you can again come up with part two and part three.

Part three is figured out You just have to figure out in part three how programmatic video happens and images happen. Right now it's more about Defining the rules for everything In building agents, it's more about that only. Like how you did that day, right? getting deterministic rules Build on top of.

Again, it's the same exercise, but keeping in mind that this is very extendable Everything is modular Right now that first knowledge of you can connect different agents And your last thing also, so now one more thing that comes is repurposing Now if you have generated something for LinkedIn We can repurpose it across different channels Right, so let's say we generate Motion video, like for LinkedIn motion video And in LinkedIn you might have seen those picture carousels also, you know, like a group of pictures will be there, next you do it will show So you can take that and convert to a video for Instagram or TikTok So how once you have generated one thing, how do you repurpose it across? That also we have to keep in mind when we make the architecture this is good to start So you use Langrath only? Yes sir, do you suggest any other framework? No, I think that's good Like we want to be comfortable with it, right? Like it's easy The only thing later is how we run these things on production because now we are doing things locally It's okay, but at the end of the day, it's about running these things on autopilot So that time how we configure the environment, how we you know schedulers and That thing will come into picture No, it's okay, localhost only, you will run it on the localhost I think we can start with this Take a couple of days, start with this So maybe next Tuesday we can keep meeting Again Tuesday same time, let's keep until then You can explore a bit, just think about it, a lot of these things you don't It's more like 90% of the time goes in thinking and planning the right architecture Because generation is the easy part You have to put in some time, question that is this the right architecture, are we breaking down the problem in the right way It's some time doing that Tuesday we will Keep on meeting and the goal is by Friday we should have this in a week And after that it should be easy

to This is just like generating content is one type of meeting Next would be OTM, mail, in that you have to take whoever you are To reach out, take their profile, analyse what you have to pitch to them, what kind of service, that will be the next step Because once you have LinkedIn, Twitter and all, it's easy to link You just have to So in this pipeline, whatever three pieces we divided into The fourth will be LinkedIn, Twitter, like where you post Technically you are really social You think about it, so any other question? You need anything, if you have any questions, just feel free to reach out Otherwise, I will see you on Tuesday Thanks for your attention and see you on Friday
